

LexRay™

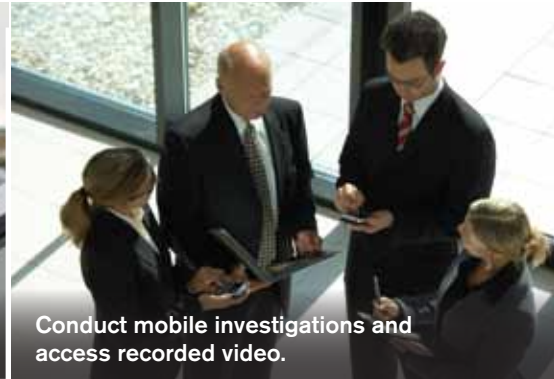

BY LEXTECH LABS

Manage critical incidents and send to first responders.

Control remote surveillance.

Conduct mobile investigations and access recorded video.

Video That Just Works

LexRay gives you immediate and easy access to your video surveillance system allowing your team to make high value and high risk decisions quickly. The LexRay server optimizes your video for the best lag free mobile experience possible.

LexRay was made to provide teams with one common mobile video platform that is easy to use. In a critical situation, you can ensure your entire team is seeing the same video. Your team can simultaneously view video from multiple vendors on one screen. No other solution delivers these capabilities.

Common Platform

No Lag

Multi VMS Support

Secure Video

LexRay™

It just works!

Benefits of LexRay include:

- **Common Platform.** LexRay allows all members of a team to view the same video for mobile investigations or managing live critical incidents, no matter which mobile device they use. LexRay works on all iOS devices, web browsers and Blackberry platforms.
- **No Lag.** LexRay constantly monitors the latency and optimizes the video stream. This happens for every user and every video feed independently so as each users' network conditions change, their video also changes. This provides lag free video regardless of the connection type. The user can trust that what they are seeing is what is happening right now.
- **Multi-VMS Support.** The multi-VMS capability puts video from many different VMS platforms all on screen at the same time. Many existing infrastructures are mixed environments and require the use of different tools to view them all. LexRay puts all that information in a single interface. That means a user can have video from multiple Milestone, OnSSI, Vaytek, View Commander or other systems all usable at the same time.
- **Secure Video.** The LexRay server sits in front of the VMS systems (presumably in a DMZ) while the VMS stays protected on the private LAN. The communications between the server and the mobile client can all be encrypted with SSL. This encrypts the video being delivered into the field providing complete end to end secure video.

Features of LexRay include:

- View recorded video in a split screen format.
- Mobile optimized video for a superior lag free mobile experience.
- Toggle between camera views to view an incident from different views.
- The application is intuitive and launches immediately when selected.
- Open mobile video standard for VMS, camera and specialty video providers.
- Identify events through alerts or the calendar menu, immediate playback, rewind, forward and slow motion your recorded video.
- Unlimited cameras, unlimited video servers and unlimited users.
- Pan, tilt and zoom features standard on all mobile clients.

Technical Specifications

Privacy & Security:

5 layers of encryption and a minimum of 3 layers of authentication before video can be accessed.

Network Compatibility:

WiFi or Cellular Data. (4G, 3G, 2G)

Network Optimization:

Adjusts video speed/flow based on connection speed.
