

Reed City Schools Using C3 to Monitor Facilities, Transportation and Operations

Facilities Manager uses C3 to monitor six school buildings, transportation, staff and operations

Operational Use of Video

Reed City School District has been in existence since 1872 and now includes six buildings housing over 2,000 students, teachers, staff and administration. The school district supports an administration building as well as its own transportation facility and does provide both public and private schools for K-12. The facilities and transportation director, Paul Lewis, found that he had a need to manage these multiple buildings and operations. To assist him, he chose to install 56 video cameras to assist him in his management.

The school district is rated as a top notch school in the area and therefore, the director wanted to remain on the cutting edge to ensure smooth operations of the facilities. With the assistance of the Lextech Labs C3 technology, Lewis was able to install the mobile solution so that cameras could be accessed after hours.

Solution

With C3, the director is now able to watch video after hours to check unauthorized access to buildings, monitor contracted custodial activities, track fueling station activities at transportation facilities, remotely check parking lots for snow

removal and parking issues, and to operationally place cameras to ensure they are viewing the high value assets.

Result

Through the assistance of Lextech Labs, Lewis and his staff are now able to manage these facilities much more effectively. Due to recent budget cuts, the staff has been reduced and they are finding it easier to manage their facilities using C3. Additionally, they have been able to manage fueling and utilities costs by monitoring facilities. Through this, they were able to reduce some of their costs.
